NIR late-time spectra in the literature

Motohara+2006

Type Ia Supernovae – evolution of IR spectra

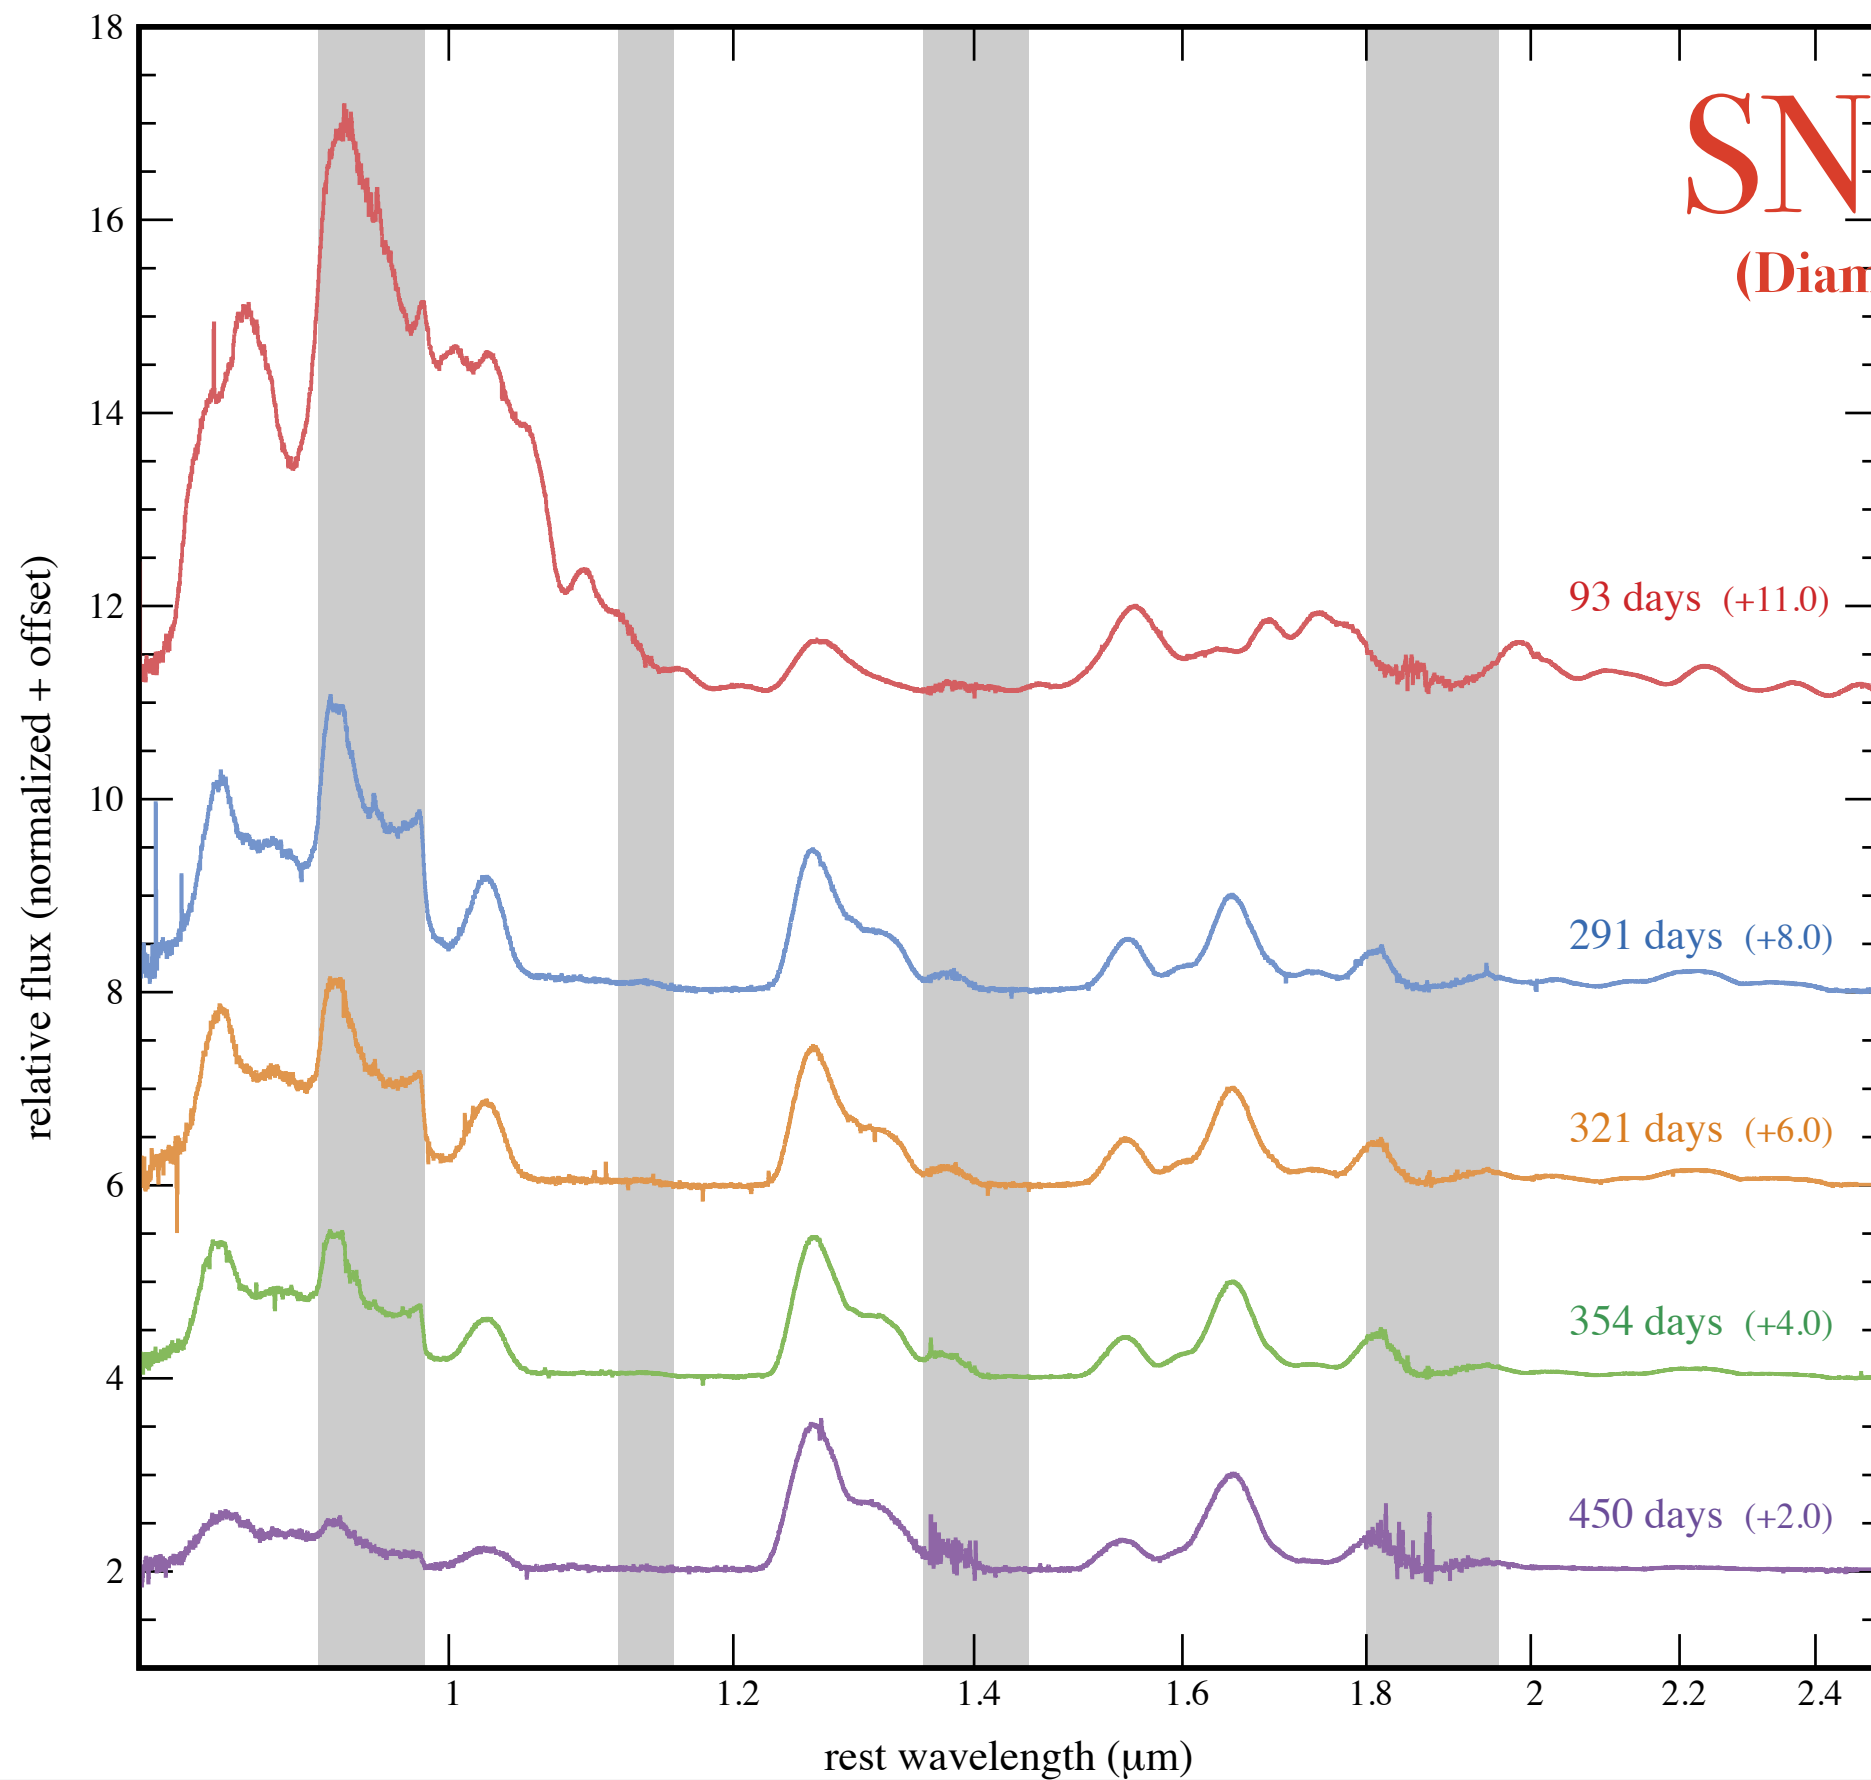

SN 2005df (modified from Diamond+2015)

SN 2014J

(Diamond+submitted)

[Fe II] 1.6440 μm

use NIR late-time spectra to
differentiate central densities of the
WD just prior to explosion

Models: spherical DDT models by Hoeflich

Models: spherical DDT models by Hoeflich

ρ_c effect on line profiles

SN 2014J: comparing line widths to models Q_c

increasing accretion rate →

WD central density	accretion material
$\rho_c \geq 10^9 \text{ g/cm}^3$	H, He, C-O accretion
$\rho_c \leq 10^9 \text{ g/cm}^3$	He, C-O accretion
$\rho_c \leq 0.5 \times 10^9 \text{ g/cm}^3$	C-O accretion

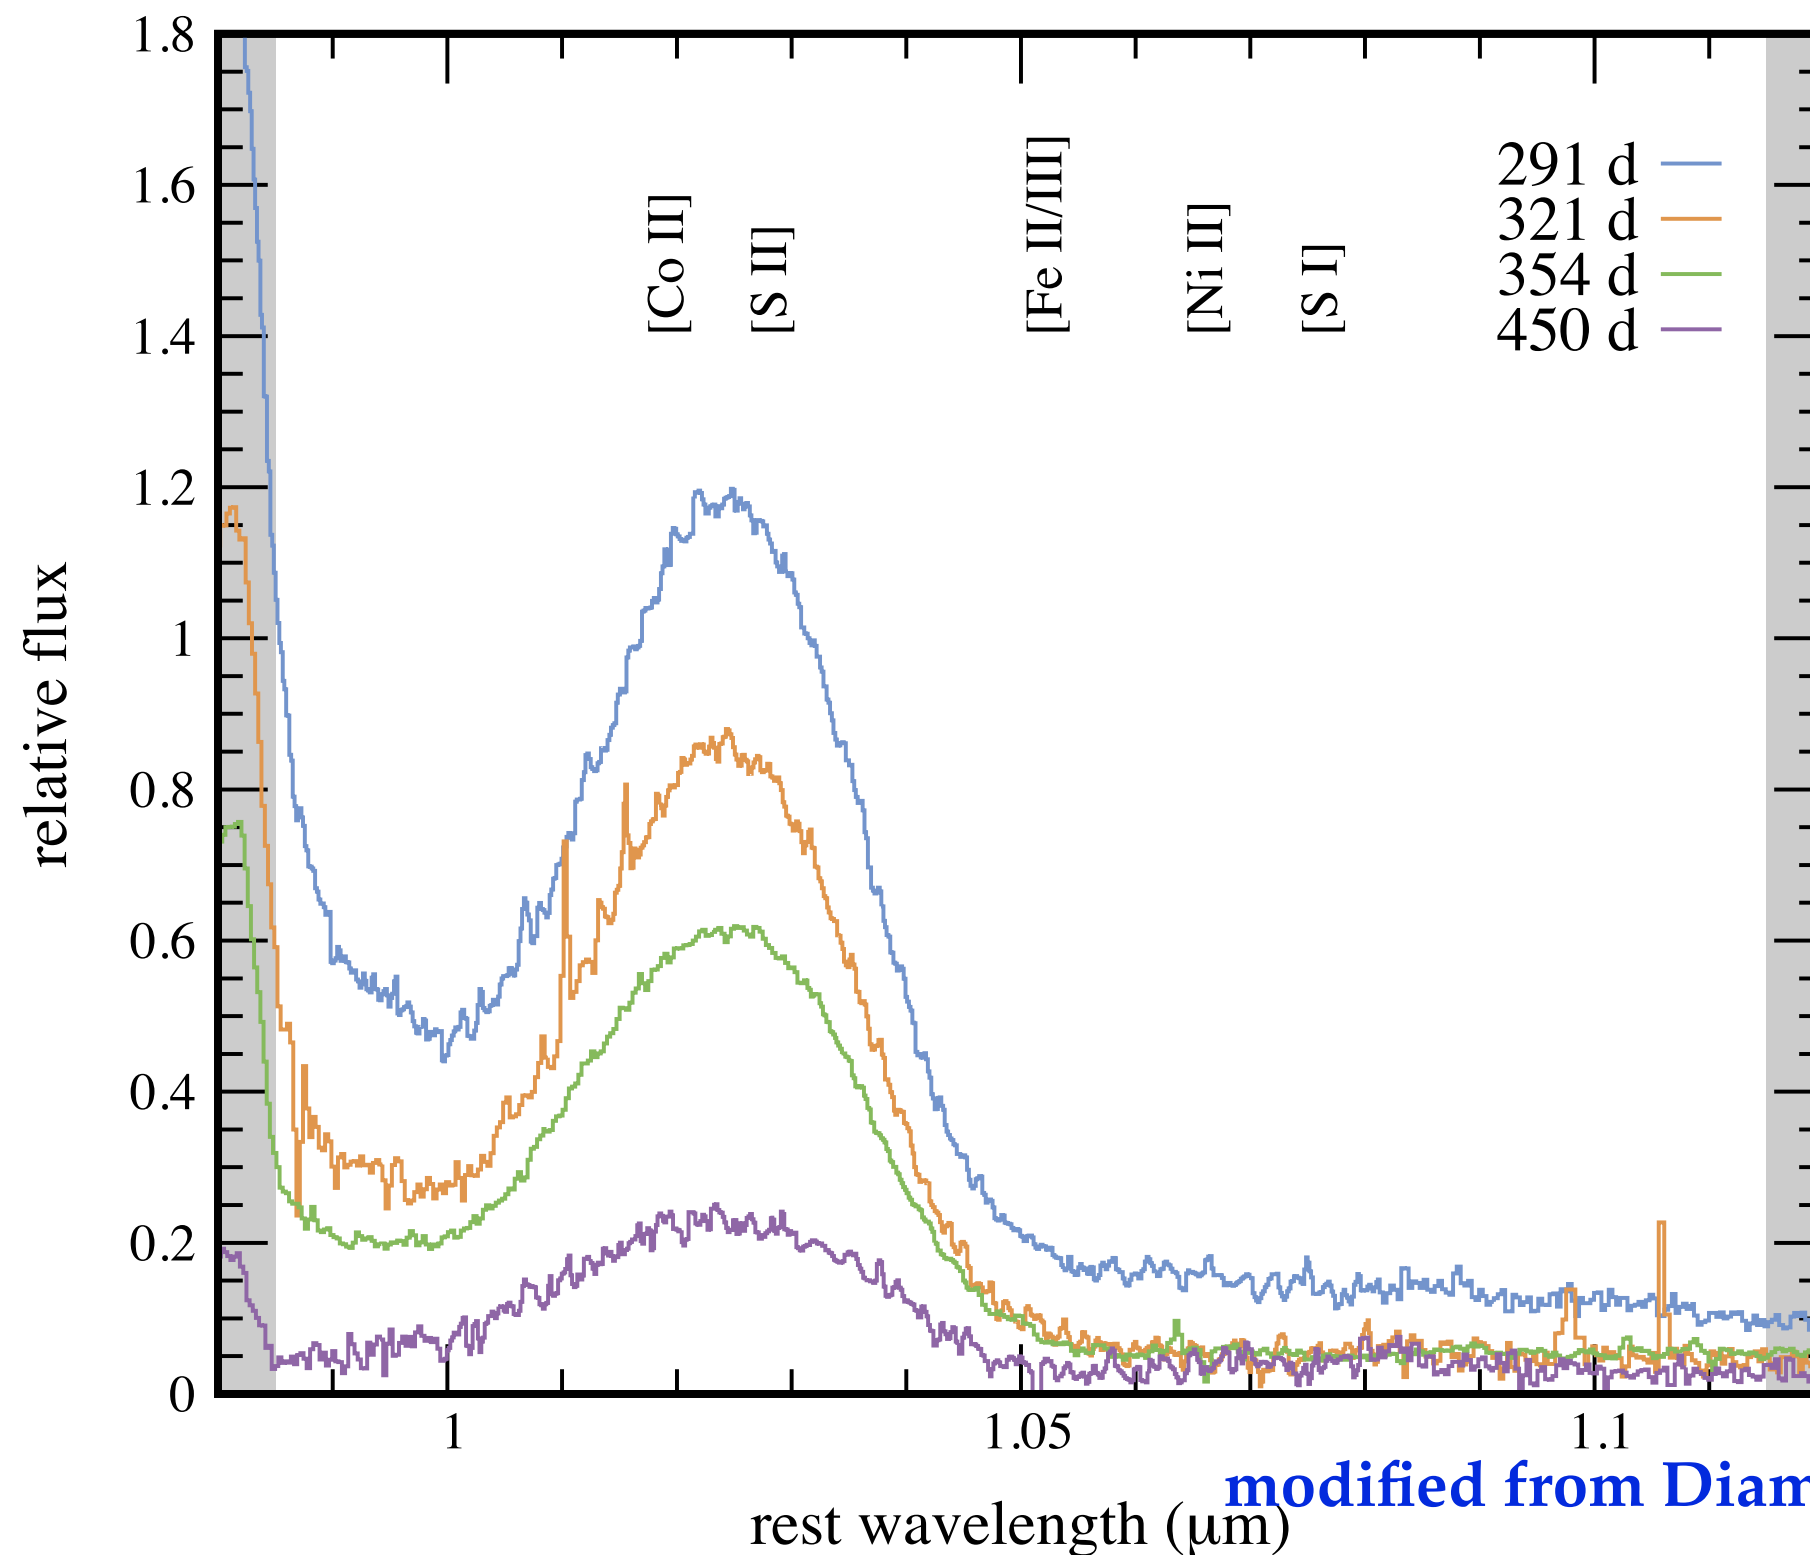

increasing accretion rate →

and presence of magnetic fields
embedded in the expanding ejecta

SN 2005df: comparing line widths to models ρ_c and B

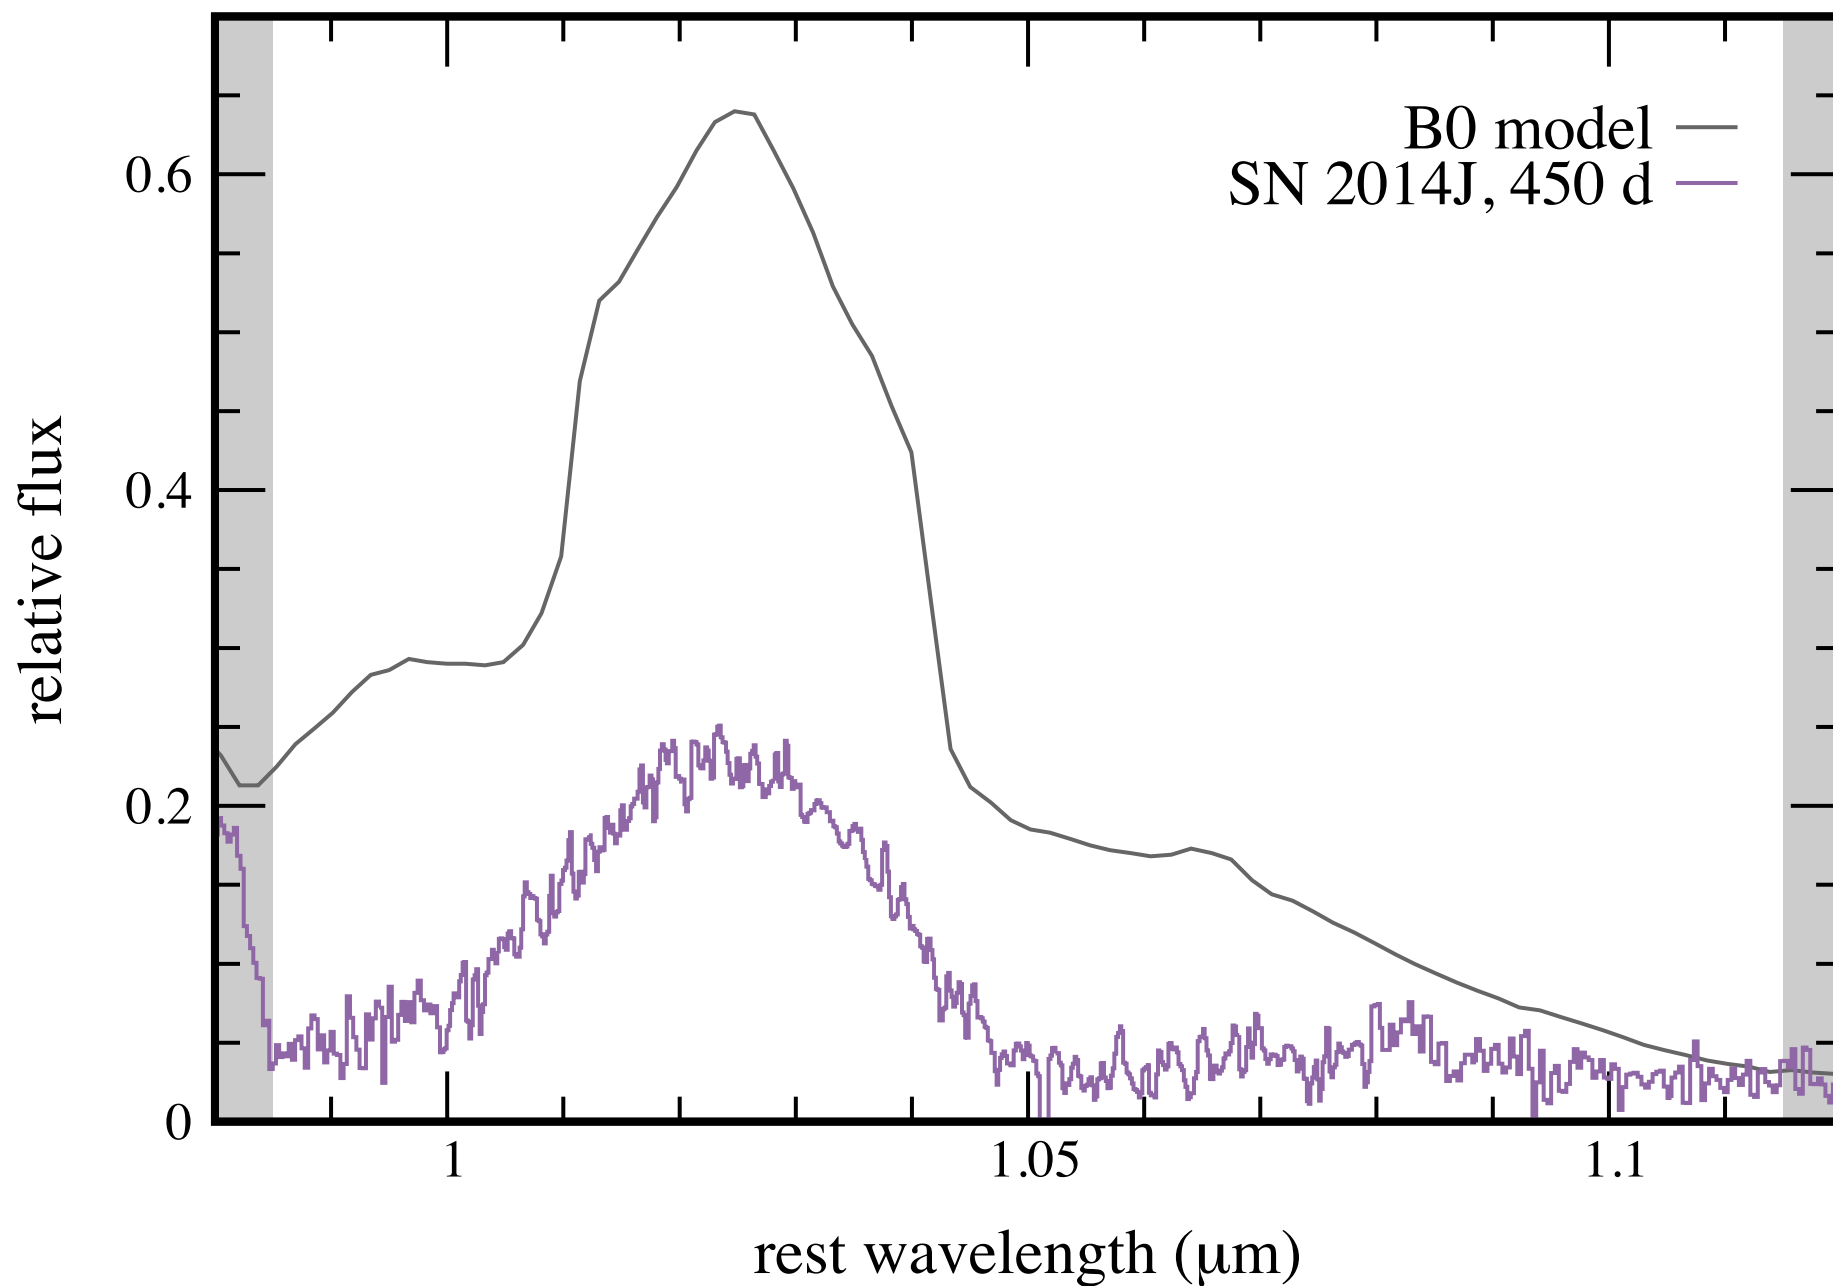

2014J 1.03 μm feature evolution

modified from Diamond+submitted

model with **B=0 G** produces too much flux

modified from Diamond+submitted

model with $B=10^6$ G

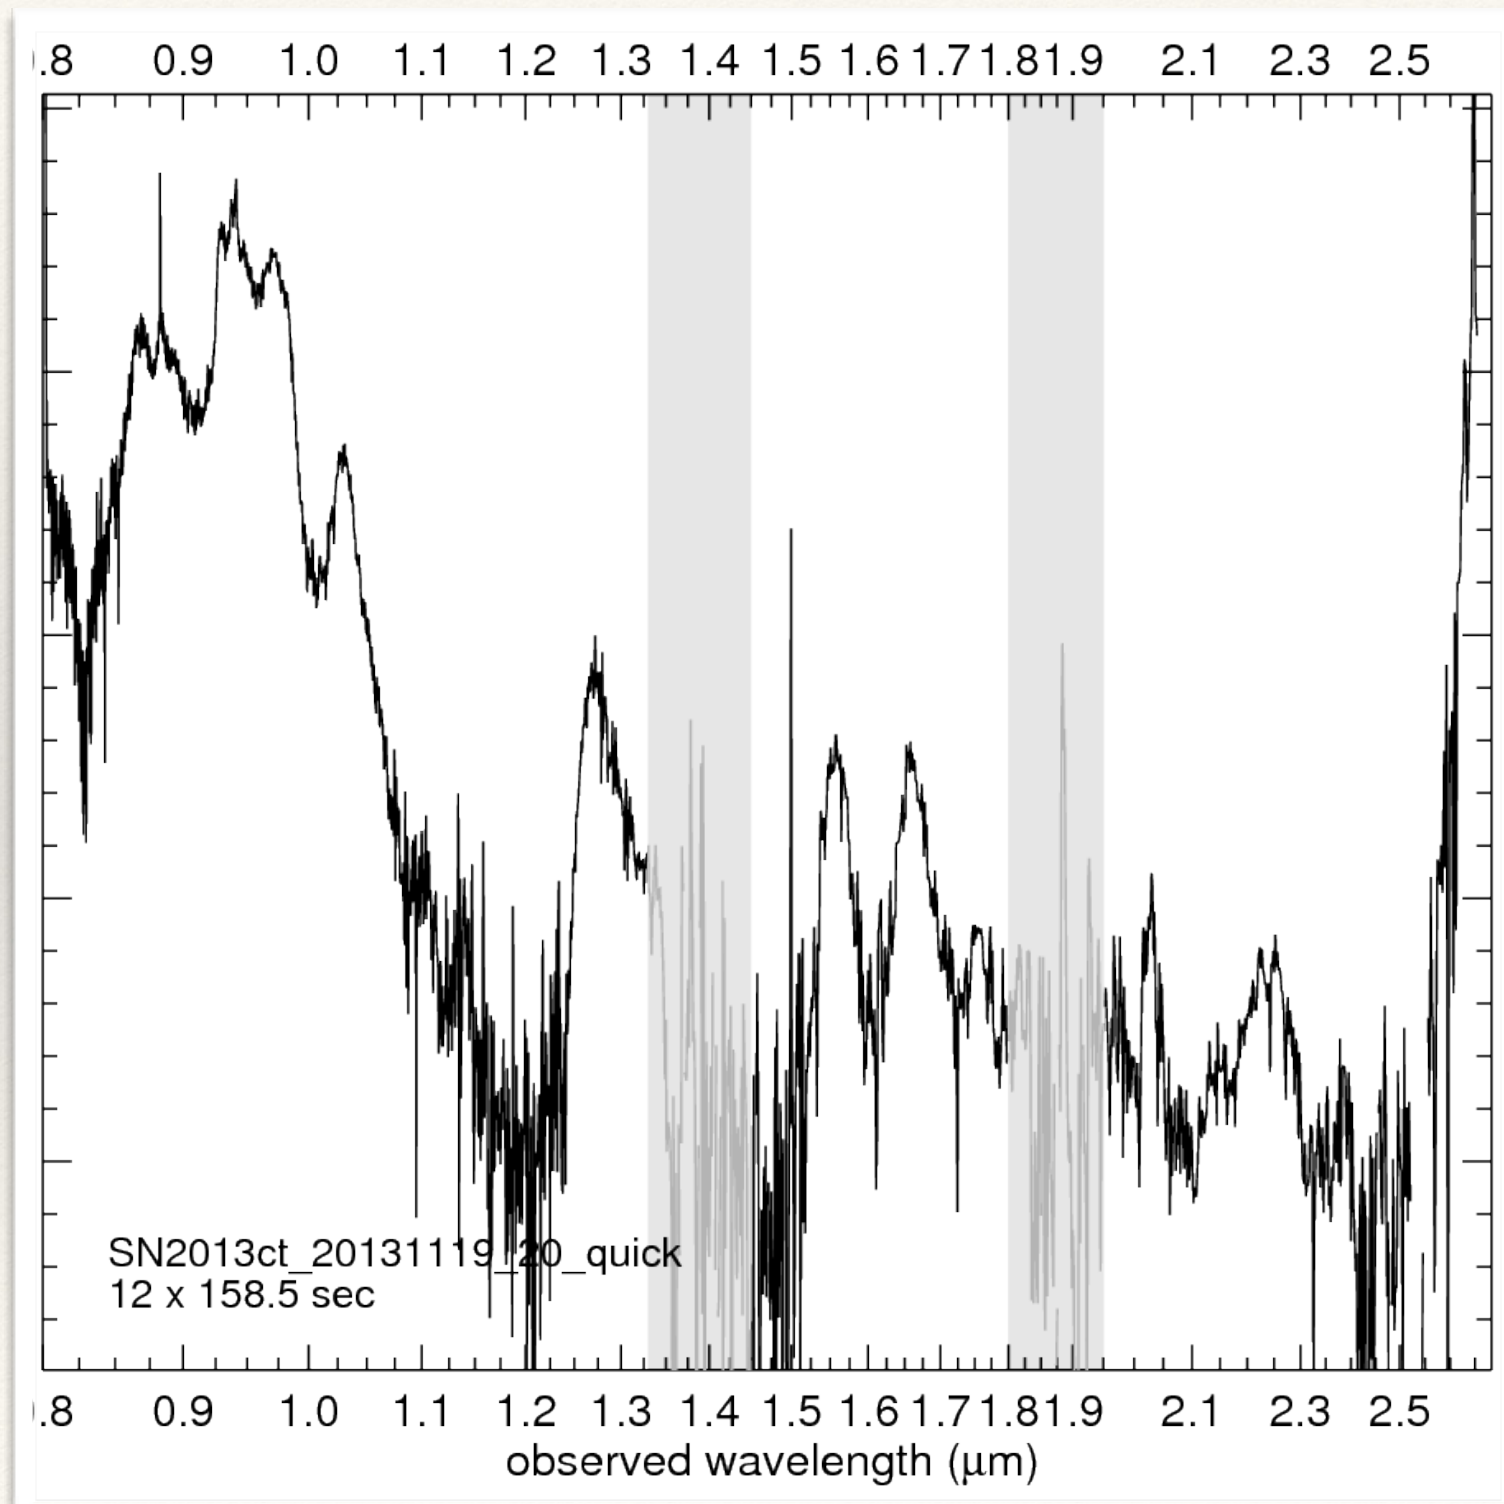

modified from Diamond+submitted

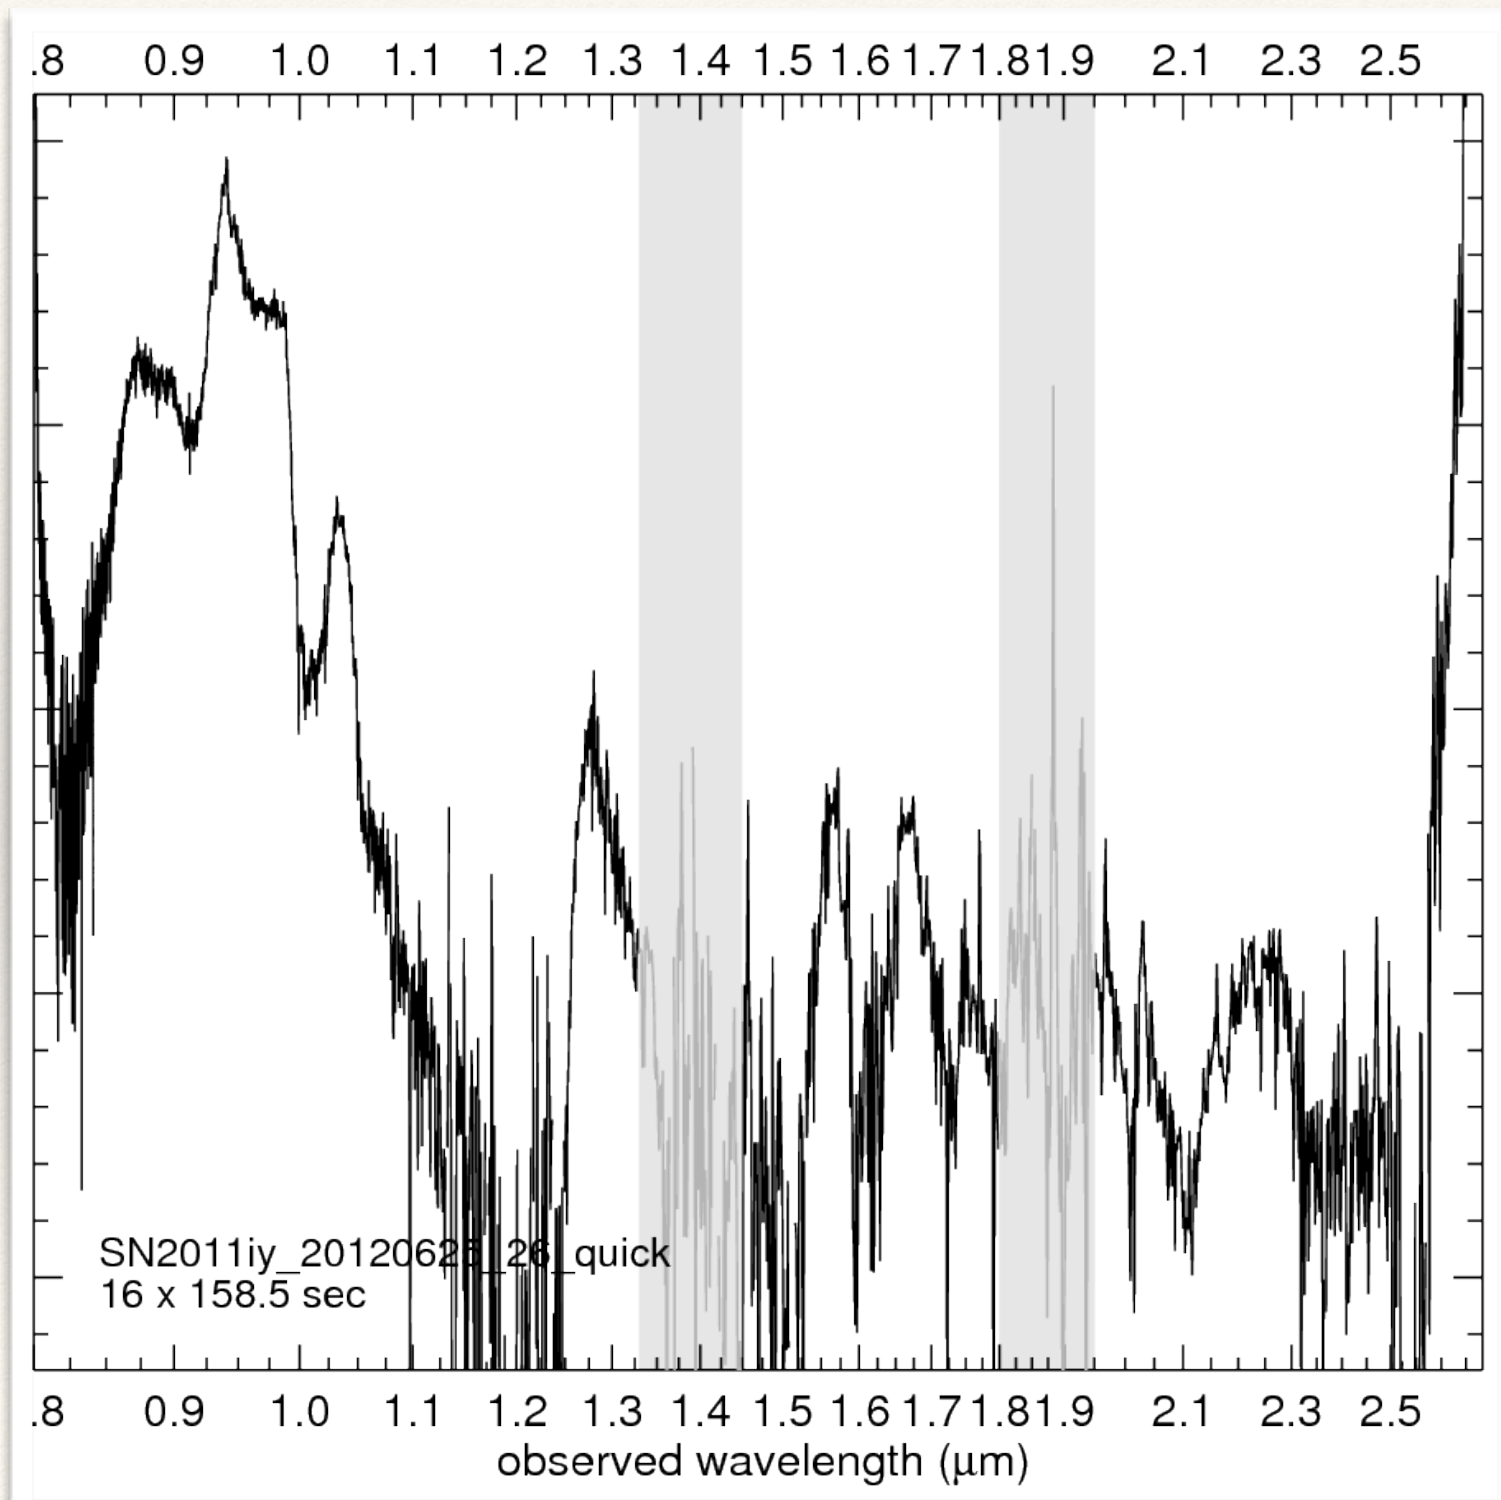

sample from CSP2 with several
multi-epoch late-time observations

upcoming work by Hsiao, Kumar, Diamond+

CSP2 Partial Reduction: SN 2013ct 199 days

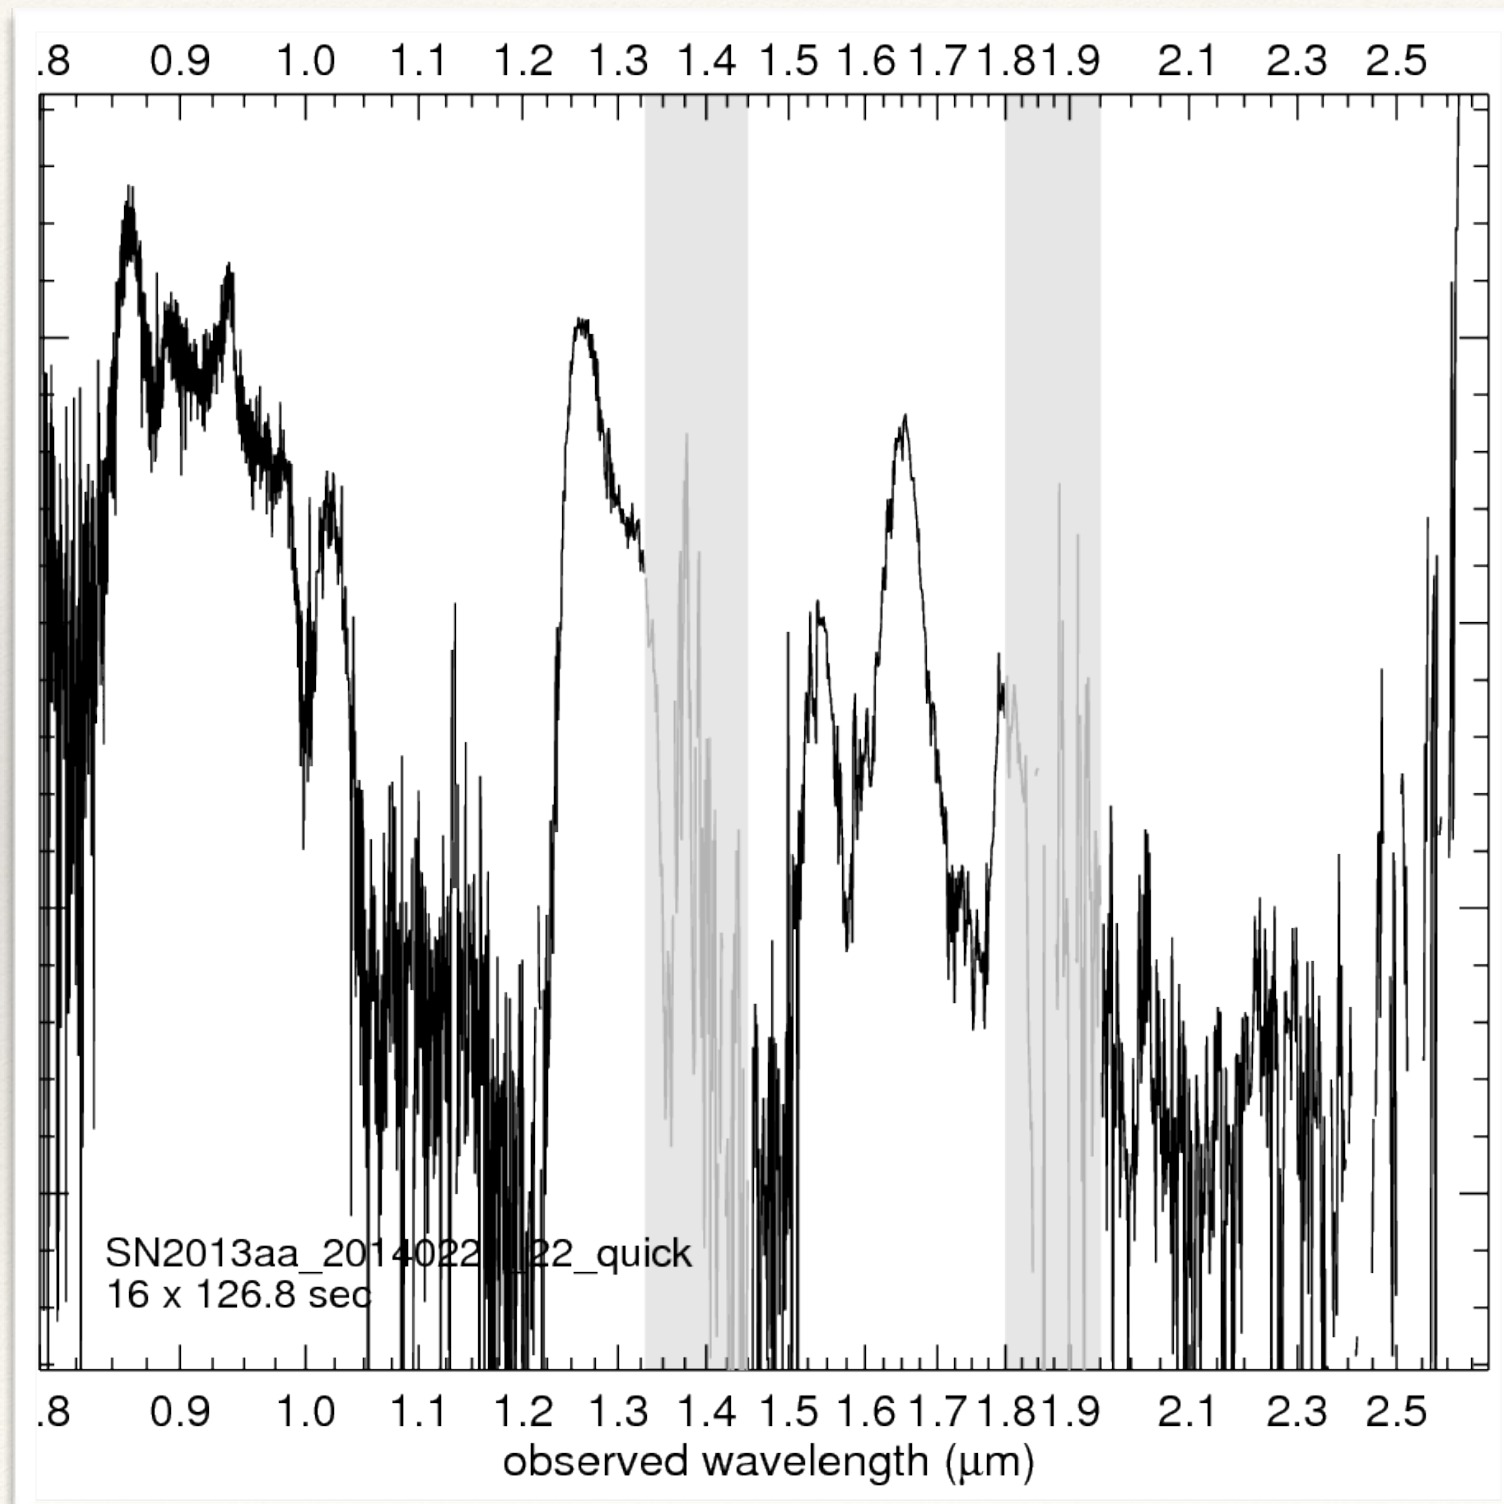

CSP2 Partial Reduction: SN 2011iy 208 days

CSP2 Partial Reduction: SN 2012cg 289 days

CSP2 Partial Reduction: SN 2013aa 367 days

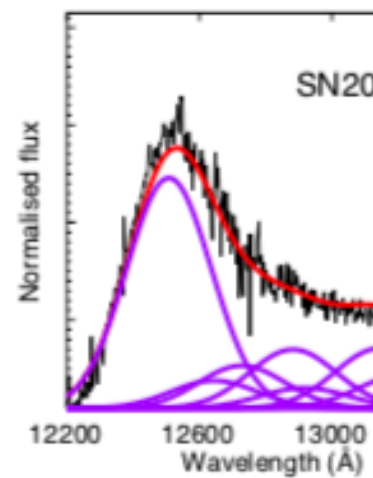

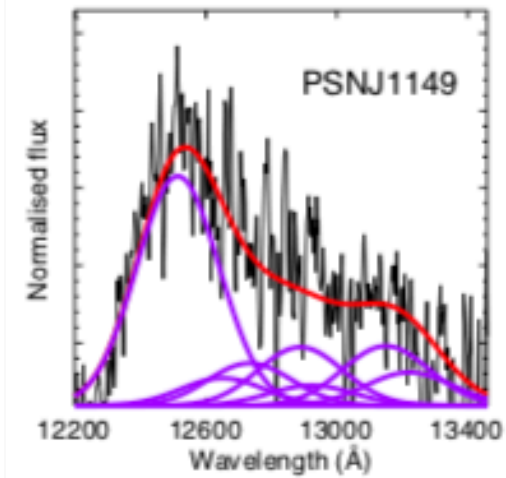

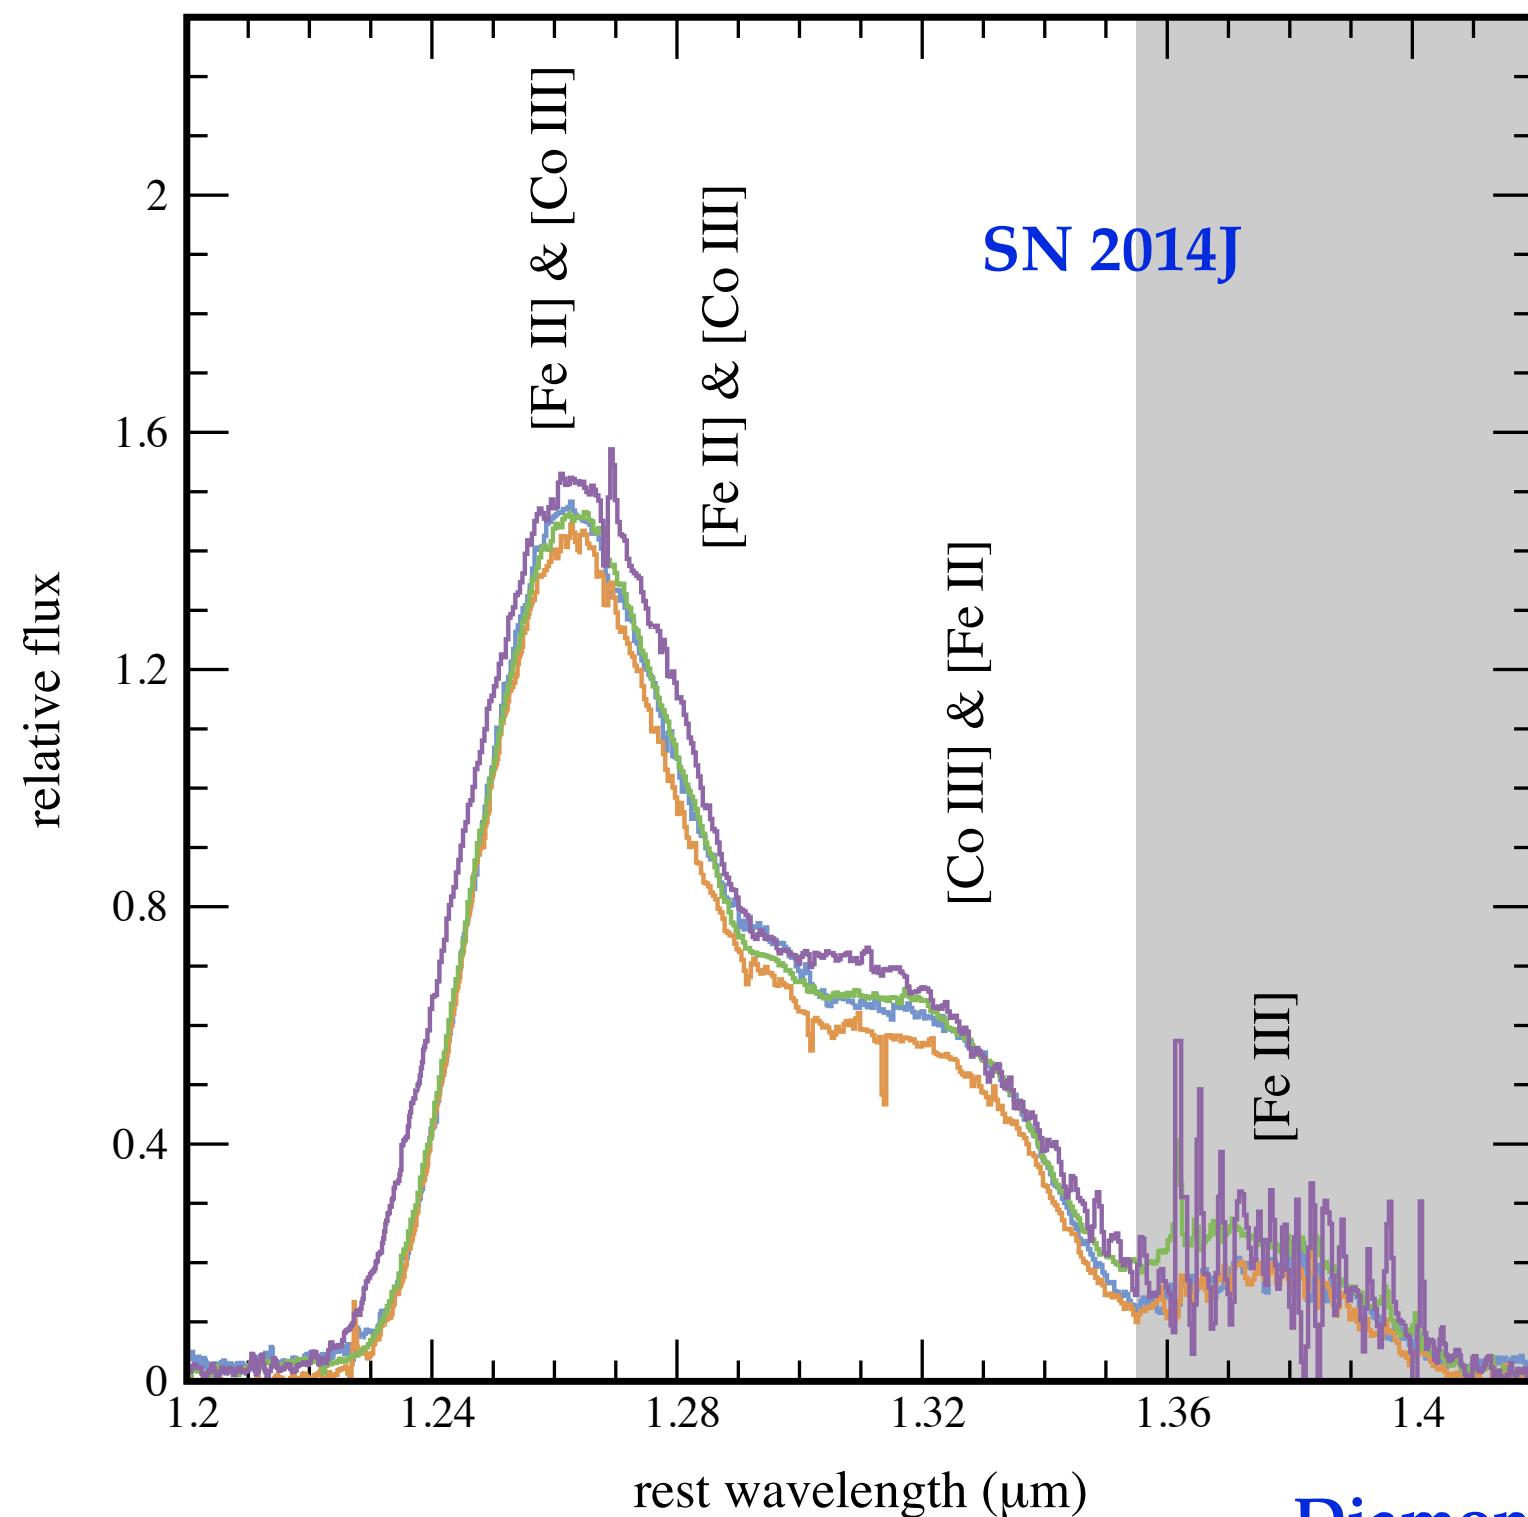

CSP2 Partial Reduction: SN 2012fr 468 days

comparison of SNe 2005df and 2014J

J-band region

Maguire+2018

Diamond+submitted

K-band region

2014J 1.65 μm feature evolution

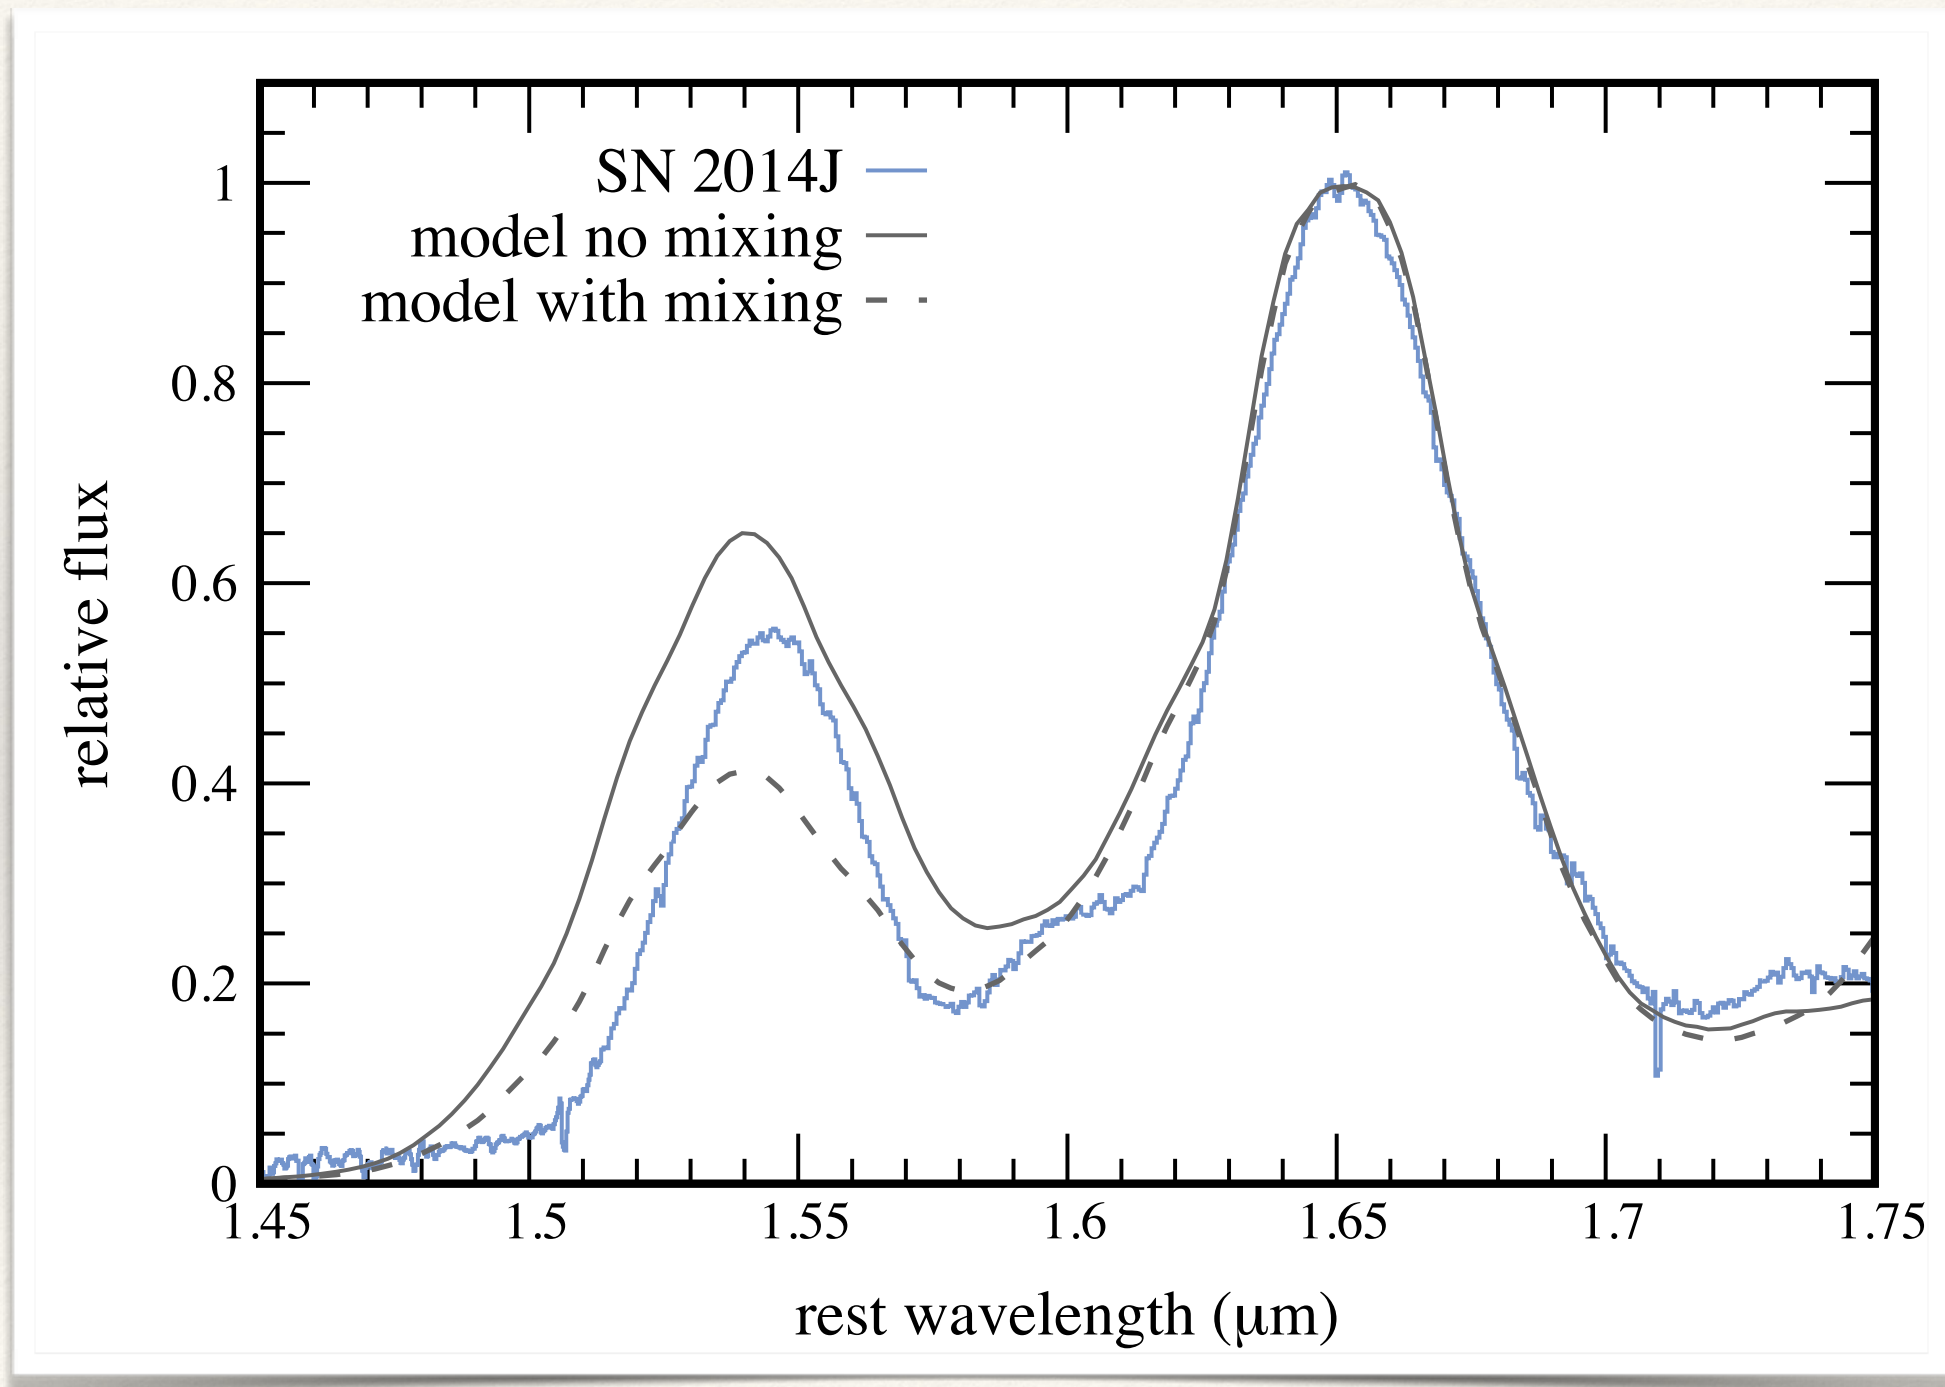

2014J 1.54 μm feature evolution

comparison with models w/ and w/o mixing

comparison with non- M_{ch} models

2014J 1.65 μm feature evolution

asymmetry in the evolution of the [Fe II] 1.6440 μm line

asymmetry in the evolution of the [Fe II] 1.6440 μm line
